Measuring Polytopes

Rational polytope — convex hull of finitely many points in \mathbb{Q}^d — solution set of a system of linear (in-)equalities with integer coefficients

Goal: measuring...

$$ightharpoonup \operatorname{vol}(\mathcal{P}) = \lim_{n \to \infty} \frac{1}{n^d} \left| \mathcal{P} \cap \frac{1}{n} \mathbb{Z}^d \right|$$

lacksquare discrete volume $|\mathcal{P} \cap \mathbb{Z}^d|$

Ehrhart function
$$\operatorname{ehr}_{\mathcal{P}}(n) := \left| \mathcal{P} \cap \frac{1}{n} \mathbb{Z}^d \right| = \left| n \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } n \in \mathbb{Z}_{>0}$$

Discrete Volumes & Ehrhart Quasipolynomials

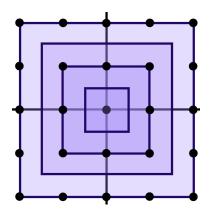

Rational polytope — convex hull of finitely many points in \mathbb{Q}^d

 $q(n) = c_d(n) n^d + \cdots + c_0(n)$ is a quasipolynomial if $c_0(n), \ldots, c_d(n)$ are periodic functions; the lcm of their periods is the period of q(n).

Theorem (Ehrhart 1962) For any rational polytope $\mathcal{P} \subset \mathbb{R}^d$, $\operatorname{ehr}_{\mathcal{P}}(n) := |n\mathcal{P} \cap \mathbb{Z}^d|$ is a quasipolynomial in the integer variable n whose period divides the lcm of the denominators of the vertex coordinates of P (the denominator of P).

Example
$$\mathcal{P} = [-\frac{1}{2}, \frac{1}{2}]^2$$

Discrete Volumes & Ehrhart Quasipolynomials

Rational polytope — convex hull of finitely many points in \mathbb{Q}^d

 $q(n) = c_d(n) n^d + \cdots + c_0(n)$ is a quasipolynomial if $c_0(n), \ldots, c_d(n)$ are periodic functions; the lcm of their periods is the period of q(n).

Theorem (Ehrhart 1962) For any rational polytope $\mathcal{P} \subset \mathbb{R}^d$, $\operatorname{ehr}_{\mathcal{P}}(n) := |n\mathcal{P} \cap \mathbb{Z}^d|$ is a quasipolynomial in the integer variable n whose period divides the lcm of the denominators of the vertex coordinates of P (the denominator q of P).

Equivalently, the Ehrhart series can be written as

$$\operatorname{Ehr}_{\mathcal{P}}(z) := 1 + \sum_{n \ge 1} \operatorname{ehr}_{\mathcal{P}}(n) z^n = \frac{\operatorname{h}_{\mathcal{P}}^*(z)}{(1 - z^q)^{\dim \mathcal{P} + 1}}$$

Why care about... Ehrhart (Quasi-)Polynomials

- ► Linear systems are everywhere, and so polyhedra are everywhere.
- ▶ In applications, the volume of the polytope represented by a linear system measures some fundamental data of this system ("average").
- ► Polytopes are basic geometric objects, yet even for these basic objects volume computation is hard and there remain many open problems.
- Many discrete problems in various mathematical areas are linear problems, thus they ask for the discrete volume of a polytope in disguise.
- ► Much discrete geometry can be modeled using polynomials and, conversely, many combinatorial polynomials can be modeled geometrically.

Motivation I: Really?

 $\mathcal{P} \subset \mathbb{R}^d$ — rational polytope

Ehrhart functions
$$\operatorname{ehr}_{\mathcal{P}}(n) := \left| \mathcal{P} \cap \frac{1}{n} \mathbb{Z}^d \right| = \left| n \mathcal{P} \cap \mathbb{Z}^d \right|$$
 for $n \in \mathbb{Z}_{>0}$
$$\overline{\operatorname{rehr}_{\mathcal{P}}}(\lambda) := \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } \lambda \in \mathbb{R}_{>0}$$

$$\operatorname{rehr}_{\mathcal{P}}(\lambda) := \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } \lambda \in \mathbb{Q}_{>0}$$

Fun Fact (Linke 2011, Baldoni–Berline–Köppe–Vergne 2013, Stapledon 2017). There is an Ehrhart theory for the quasipolynomial $\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda)$ in the real variable λ .

Motivation I: Really?

 $\mathcal{P} \subset \mathbb{R}^d$ — rational polytope

Ehrhart functions
$$\operatorname{ehr}_{\mathcal{P}}(n) := \left| \mathcal{P} \cap \frac{1}{n} \mathbb{Z}^d \right| = \left| n \mathcal{P} \cap \mathbb{Z}^d \right|$$
 for $n \in \mathbb{Z}_{>0}$
$$\overline{\operatorname{rehr}_{\mathcal{P}}}(\lambda) := \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } \lambda \in \mathbb{R}_{>0}$$

$$\operatorname{rehr}_{\mathcal{P}}(\lambda) := \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } \lambda \in \mathbb{Q}_{>0}$$

Fun Fact (Linke 2011, Baldoni–Berline–Köppe–Vergne 2013, Stapledon 2017). There is an Ehrhart theory for the quasipolynomial $\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda)$ in the real variable λ .

Examples
$$\bar{r}ehr_{[1,2]}(\lambda)=\lfloor 2\lambda\rfloor-\lceil\lambda\rceil+1=\lambda+1-\{2\lambda\}-\{-\lambda\}$$

$$\bar{r}ehr_{[-1,\frac{2}{3}]}(\lambda)=\frac{5}{3}\lambda+1-\{\frac{2}{3}\lambda\}-\{\lambda\}$$

Motivation II: Ehrhart Veronese

 $\mathcal{P} \subset \mathbb{R}^d$ — lattice polytope

Ehrhart function
$$\operatorname{ehr}_{\mathcal{P}}(n) := \left| \mathcal{P} \cap \frac{1}{n} \mathbb{Z}^d \right| = \left| n \mathcal{P} \cap \mathbb{Z}^d \right| \text{ for } n \in \mathbb{Z}_{>0}$$

Ehrhart series
$$\operatorname{Ehr}_{\mathcal{P}}(z) := 1 + \sum_{n \geq 1} \operatorname{ehr}_{\mathcal{P}}(n) z^n = \frac{\operatorname{h}_{\mathcal{P}}^*(z)}{(1-z)^{\dim \mathcal{P}+1}}$$

Fun Fact (Brenti-Welker 2009, MB-Stapledon 2010, Jochemko 2018). The Ehrhart series of $k\mathcal{P}$ becomes nicer as k increases.

A Bit of Real Ehrhart History

Theorem (Linke 2011) Let $\mathcal{P} \subset \mathbb{R}^d$ be a rational polytope. Then $\operatorname{rehr}_{\mathcal{P}}(\lambda) = \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right|$ is a quasipolynomial in the rational variable λ whose period divides the smallest rational q such that $q\mathcal{P}$ is a lattice polytope.

Linke also proved rational analogs of the Ehrhart–Macdonald reciprocity theorem and McMullen's theorem about the periods of the coefficient functions when writing

$$\operatorname{rehr}_{\mathcal{P}}(\lambda) = c_d(\lambda) \lambda^d + c_{d-1}(\lambda) \lambda^{d-1} + \dots + c_0(\lambda)$$

She views these coefficient functions as piecewise polynomials and proved a differential equation for them.

A Bit of Real Ehrhart History

Theorem (Linke 2011) Let $\mathcal{P} \subset \mathbb{R}^d$ be a rational polytope. Then $\operatorname{rehr}_{\mathcal{P}}(\lambda) = \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right|$ is a quasipolynomial in the rational variable λ whose period divides the smallest rational q such that $q\mathcal{P}$ is a lattice polytope.

Linke also proved rational analogs of the Ehrhart–Macdonald reciprocity theorem and McMullen's theorem about the periods of the coefficient functions when writing

$$\operatorname{rehr}_{\mathcal{P}}(\lambda) = c_d(\lambda) \lambda^d + c_{d-1}(\lambda) \lambda^{d-1} + \dots + c_0(\lambda)$$

She views these coefficient functions as piecewise polynomials and proved a differential equation for them.

Baldoni–Berline–Köppe–Vergne (2013): algorithmic theory of intermediate sums on polyhedra, with $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ as a special case.

A Bit of Real Ehrhart History

Motivated by motivic integration, Stapledon (2008) introduced the weighted h^* -polynomial of a lattice polytope $\mathcal{P} \subset \mathbb{R}^d$, which he later (2017) realizes via

$$1 + \sum_{\lambda \in \mathbb{Q}_{>0}} \left| \partial_{\neq 0}(\lambda \mathcal{P}) \cap \mathbb{Z}^d \right| t^{\lambda} = \frac{\widetilde{h}_{\mathcal{P}}(t)}{(1 - t)^{\dim \mathcal{P}}}$$

and uses them to compute Ehrhart polynomials of free sums, generalizing work by Braun (2006) and MB-Jayawant-McAllister (2013).

He realizes that $h_{\mathcal{P}}(t)$ is a polynomial in certain fractional powers of t with nonnegative coefficients. In the case that $0 \in \mathcal{P}^{\circ}$ he proves that $\widetilde{h}_{\mathcal{P}}(t)$ is symmetric.

The Setup

$$\mathcal{P} \subset \mathbb{R}^d$$
 — rational polytope \longrightarrow $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$

The codemoninator of \mathcal{P} is $r := lcm(\mathbf{b})$

Lemma (1) $\operatorname{rehr}_{\mathcal{P}}(\lambda) = \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right|$ is constant for $\lambda \in (\frac{n}{r}, \frac{n+1}{r}), n \in \mathbb{Z}_{\geq 0}$ (2) If $\mathbf{0} \in \mathcal{P}$ then $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ is monotone

Examples
$$\bar{r}ehr_{[1,2]}(\lambda) = \lambda + 1 - \{2\lambda\} - \{-\lambda\}$$

$$\overline{\text{rehr}}_{[-1,\frac{2}{3}]}(\lambda) = \frac{5}{3}\lambda + 1 - \{\frac{2}{3}\lambda\} - \{\lambda\}$$

The Setup

$$\mathcal{P} \subset \mathbb{R}^d$$
 — rational polytope

$$\longrightarrow \qquad \mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b}
ight\}$$

The codemoninator of \mathcal{P} is $r := lcm(\mathbf{b})$

Lemma (1) rehr $_{\mathcal{P}}(\lambda) = |\lambda \mathcal{P} \cap \mathbb{Z}^d|$ is constant for $\lambda \in (\frac{n}{r}, \frac{n+1}{r}), n \in \mathbb{Z}_{>0}$ (2) If $\mathbf{0} \in \mathcal{P}$ then $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ is monotone

Corollary

$$\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda) = \begin{cases} \operatorname{rehr}_{\mathcal{P}}(\lambda) & \text{if } \lambda \in \frac{1}{r} \mathbb{Z}_{\geq 0} \\ \operatorname{rehr}_{\mathcal{P}}(\lfloor \lambda \rceil) & \text{if } \lambda \notin \frac{1}{r} \mathbb{Z}_{\geq 0} \end{cases}$$

where
$$\lfloor \lambda
ceil := rac{2j+1}{2r}$$
 for $\left| \lambda - rac{2j+1}{2r}
ight| < rac{1}{2r}$

If
$$\mathbf{0} \in \mathcal{P}$$
 then $\overline{\mathrm{rehr}}_{\mathcal{P}}(\lambda) = \mathrm{rehr}_{\mathcal{P}}\left(\frac{\lfloor r\lambda \rfloor}{r}\right)$

The Setup

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

If
$$\mathbf{0} \in \mathcal{P}$$
 then $\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda) = \left| \lambda \mathcal{P} \cap \mathbb{Z}^d \right| = \operatorname{rehr}_{\mathcal{P}} \left(\frac{\lfloor r \lambda \rfloor}{r} \right)$

If $\mathbf{0} \notin \mathcal{P}$ then

$$\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda) = \begin{cases} \operatorname{rehr}_{\mathcal{P}}(\lambda) & \text{if } \lambda \in \frac{1}{r} \mathbb{Z}_{\geq 0} \\ \operatorname{rehr}_{\mathcal{P}}(\lfloor \lambda \rceil) & \text{if } \lambda \notin \frac{1}{r} \mathbb{Z}_{\geq 0} \end{cases}$$

where
$$\lfloor \lambda \rceil := \frac{2j+1}{2r}$$
 for $\left| \lambda - \frac{2j+1}{2r} \right| < \frac{1}{2r}$

The Upshot $\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda)$ is determined by $\left\{\operatorname{rehr}_{\mathcal{P}}(\lambda):\lambda\in\frac{1}{2r}\mathbb{Z}_{\geq0}\right\}$

If $\mathbf{0} \in \mathcal{P}$ then $\overline{\mathrm{rehr}}_{\mathcal{P}}(\lambda)$ is determined by $\left\{ \mathrm{rehr}_{\mathcal{P}}(\lambda) : \lambda \in \frac{1}{r}\mathbb{Z}_{\geq 0} \right\}$

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

(Refined) rational Ehrhart series

$$\operatorname{REhr}_{\mathcal{P}}(t) := 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda}$$

$$RREhr_{\mathcal{P}}(t) := 1 + \sum_{\lambda \in \frac{1}{2r}\mathbb{Z}_{>0}} rehr_{\mathcal{P}}(\lambda) t^{\lambda}$$

Examples

$$\operatorname{REhr}_{[-1,\frac{2}{3}]}(t) = \frac{1 + t^{\frac{1}{2}} + t + t^{\frac{3}{2}} + t^{2}}{(1 - t)(1 - t^{\frac{3}{2}})}$$

RREhr_[1,2](t) =
$$\frac{1 + t^{\frac{1}{2}} + t^{\frac{3}{4}} + t^{\frac{5}{4}}}{(1-t)^2}$$

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

(Refined) rational Ehrhart series

$$\operatorname{REhr}_{\mathcal{P}}(t) := 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda}$$

$$RREhr_{\mathcal{P}}(t) := 1 + \sum_{\lambda \in \frac{1}{2r}\mathbb{Z}_{>0}} rehr_{\mathcal{P}}(\lambda) t^{\lambda}$$

Theorem Let $m \in \mathbb{Z}_{>0}$ such that $\frac{m}{r}\mathcal{P}$ is a lattice polytope. Then

$$\operatorname{REhr}_{\mathcal{P}}(t) = \frac{\operatorname{rh}_{\mathcal{P}}^{*}(t)}{\left(1 - t^{\frac{m}{r}}\right)^{d+1}}$$

where $\mathrm{rh}^*_{\mathcal{P}}(t)$ is a polynomial in $\mathbb{Z}\left[t^{\frac{1}{r}}\right]$ with nonnegative coefficients.

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

Theorem Let $m \in \mathbb{Z}_{>0}$ such that $\frac{m}{r}\mathcal{P}$ is a lattice polytope. Then

$$\operatorname{REhr}_{\mathcal{P}}(t) = 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda} = \frac{\operatorname{rh}_{\mathcal{P}}^{*}(t)}{\left(1 - t^{\frac{m}{r}}\right)^{d+1}}$$

where $\mathrm{rh}^*_{\mathcal{P}}(t)$ is a polynomial in $\mathbb{Z}\left[t^{\frac{1}{r}}\right]$ with nonnegative coefficients.

Proof Idea: $\operatorname{REhr}_{\mathcal{P}}(t) = \operatorname{Ehr}_{\frac{1}{r}\mathcal{P}}\left(t^{\frac{1}{r}}\right)$

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

Theorem Let $m \in \mathbb{Z}_{>0}$ such that $\frac{m}{r}\mathcal{P}$ is a lattice polytope. Then

$$\operatorname{REhr}_{\mathcal{P}}(t) = 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda} = \frac{\operatorname{rh}_{\mathcal{P}}^{*}(t)}{\left(1 - t^{\frac{m}{r}}\right)^{d+1}}$$

where $\mathrm{rh}^*_{\mathcal{P}}(t)$ is a polynomial in $\mathbb{Z}\left[t^{\frac{1}{r}}\right]$ with nonnegative coefficients.

Corollary The period of the quasipolynomial $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ divides $\frac{m}{r}$.

Similar results hold for $RREhr_{\mathcal{P}}(t)$, with r replaced by 2r.

Corollary (Linke 2011) Let \mathcal{P} be a lattice polytope. Then $\overline{\operatorname{rehr}}_{\mathcal{P}}(\lambda)$ and $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ are quasipolynomials of period 1.

 $\mathcal{P} = \left\{ \mathbf{x} \in \mathbb{R}^d : \mathbf{A} \, \mathbf{x} \leq \mathbf{b} \right\}$ with codemoninator $r := \operatorname{lcm}(\mathbf{b})$

Theorem Let $m \in \mathbb{Z}_{>0}$ such that $\frac{m}{r}\mathcal{P}$ is a lattice polytope. Then

$$\operatorname{REhr}_{\mathcal{P}}(t) = 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda} = \frac{\operatorname{rh}_{\mathcal{P}}^{*}(t)}{\left(1 - t^{\frac{m}{r}}\right)^{d+1}}$$

where $\mathrm{rh}^*_{\mathcal{P}}(t)$ is a polynomial in $\mathbb{Z}\left[t^{\frac{1}{r}}\right]$ with nonnegative coefficients.

Corollary (Linke 2011) For a rational polytope \mathcal{P} , $(-1)^{\dim \mathcal{P}} \overline{\mathrm{rehr}}_{\mathcal{P}}(-\lambda)$ equals the number of interior lattice points in $\lambda \mathcal{P}$, for any $\lambda > 0$.

Remark If $\frac{m}{r} \in \mathbb{Z}$ then $h_{\mathcal{P}}^*(t) = \operatorname{Int} [\operatorname{rh}_{\mathcal{P}}^*(t)].$

Gorenstein Musings

Theorem (Hibi 1991, Fiset–Kasprzyk 2008) Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. If the polar dual of \mathcal{P} is a lattice polytope then $\mathbf{h}_{\mathcal{P}}^{*}(t)$ is symmetric.

(This fits, more generally, with Stanley's theory of Gorenstein rings.)

Theorem Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. Then $\mathrm{rh}_{\mathcal{P}}^{*}(t)$ is symmetric.

Proof Idea: $(1, \mathbf{0})$ is the Gorenstein point for cone $(\{1\} \times \frac{1}{r}\mathcal{P})$.

Remark This is a corollary of a more general, technical result, with similar musings for $\operatorname{rrh}_{\mathcal{P}}^*(t)$.

Gorenstein Musings

Theorem Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. Then $\mathrm{rh}_{\mathcal{P}}^{*}(t)$ is symmetric.

Proof Idea: $(1, \mathbf{0})$ is the Gorenstein point for cone $(\{1\} \times \frac{1}{r}\mathcal{P})$.

Remark This is a corollary of a more general, technical result, with similar musings for $\operatorname{rrh}_{\mathcal{P}}^*(t)$.

Corollary Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. Then $\mathbf{h}_{\mathcal{P}}^{*}(t)$ is the Veronese of a symmetric polynomial.

Example
$$\operatorname{REhr}_{[-1,\frac{2}{3}]}(t) = \frac{1+t^{\frac{1}{2}}+2t+3t^{\frac{3}{2}}+4t^2+4t^{\frac{5}{2}}+4t^3+4t^{\frac{7}{2}}+3t^4+2t^{\frac{9}{2}}+t^5+t^{\frac{11}{2}}}{(1-t^3)^2}$$

Symmetric Decompositions

Theorem Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. Then $\mathrm{rh}_{\mathcal{P}}^{*}(t)$ is symmetric.

Corollary (Betke–McMullen 1985, MB–Braun–Vindas-Meléndez 2021+) Let \mathcal{P} be a rational polytope with denominator k and $0 \in \mathcal{P}^{\circ}$. Then there exist polynomials a(t) and b(t) with nonnegative coefficients such that

$$h_{\mathcal{P}}^*(t) = a(t) + t b(t), \quad t^{k(d+1)-1} a(\frac{1}{t}) = a(t), \quad t^{k(d+1)-2} b(\frac{1}{t}) = b(t).$$

Symmetric Decompositions

Theorem Let \mathcal{P} be a rational polytope with $\mathbf{0} \in \mathcal{P}^{\circ}$. Then $\mathrm{rh}_{\mathcal{P}}^{*}(t)$ is symmetric.

Corollary (Betke–McMullen 1985, MB–Braun–Vindas-Meléndez 2021+) Let \mathcal{P} be a rational polytope with denominator k and $0 \in \mathcal{P}^{\circ}$. Then there exist polynomials a(t) and b(t) with nonnegative coefficients such that

$$h_{\mathcal{P}}^*(t) = a(t) + t b(t), \quad t^{k(d+1)-1} a(\frac{1}{t}) = a(t), \quad t^{k(d+1)-2} b(\frac{1}{t}) = b(t).$$

Proof Idea
$$(k = 1)$$
:
$$\operatorname{REhr}_{\mathcal{P}}(t) = \frac{\operatorname{h}_{\partial(\frac{1}{r}\mathcal{P})}^{*}\left(t^{\frac{1}{r}}\right)}{\left(1 - t^{\frac{1}{r}}\right)(1 - t)^{d}}$$

Note that $h_{\partial(\frac{1}{r}P)}^*(t)$ is symmetric and nonnegative, and

$$\operatorname{rh}_{\mathcal{P}}^{*}(t) = \operatorname{Int}\left[\left(1 + t^{\frac{1}{r}} + \dots + t^{\frac{r-1}{r}}\right) \operatorname{h}_{\partial(\frac{1}{r}\mathcal{P})}^{*}\left(t^{\frac{1}{r}}\right)\right]$$

$$= \operatorname{Int}\left[\operatorname{h}_{\partial(\frac{1}{r}\mathcal{P})}^{*}\left(t^{\frac{1}{r}}\right)\right] + \operatorname{Int}\left[\left(t^{\frac{1}{r}} + t^{\frac{2}{r}} + \dots + t^{\frac{r-1}{r}}\right) \operatorname{h}_{\partial(\frac{1}{r}\mathcal{P})}^{*}\left(t^{\frac{1}{r}}\right)\right]$$

A Remark on Complexity

 $\mathcal{P} \subset \mathbb{R}^d$ — rational polytope with codemoninator r

To capture $\operatorname{rehr}_{\mathcal{P}}(\lambda)$ (or $\overline{\operatorname{rehr}_{\mathcal{P}}}(\lambda)$), we need to compute...

$$\mathbf{0} \notin \mathcal{P} \longrightarrow \operatorname{RREhr}_{\mathcal{P}}(t) = 1 + \sum_{\lambda \in \frac{1}{2r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda} = \frac{\operatorname{rrh}_{\mathcal{P}}^{*}(t)}{(1 - t^{q})^{d+1}}$$

$$\mathbf{0} \in \partial \mathcal{P} \longrightarrow \operatorname{REhr}_{\mathcal{P}}(t) = 1 + \sum_{\lambda \in \frac{1}{r}\mathbb{Z}_{>0}} \operatorname{rehr}_{\mathcal{P}}(\lambda) t^{\lambda} = \frac{\operatorname{rh}_{\mathcal{P}}^{+}(t)}{(1 - t^{q})^{d+1}}$$

$$\mathbf{0} \in \mathcal{P}^{\circ} \longrightarrow \operatorname{rh}_{\mathcal{P}}^{*}(t)$$
 symmetric

A Few Open Problems

- Periods of rational Ehrhart quasipolynomials
- Classification questions a la Kasprzyk-Nill ("reflexive polytopes of higher index" 2012)
- Stapledon's (2009) symmetric decomposition of $h_{\mathcal{P}}^*(t)$
- ► Connections to the Fine (1983) interior of a lattice polytope (Batyrev 2017, Batyrev-Kasprzyk-Schaller 2021+)
- Further applications
